Tissue Procurement: Richard M. Harland Laboratory, University of
California, Berkeley: http://tropicalis.berkeley.edu/home
CDNA Library Preparation: Richard M. Harland Laboratory, University
of California, Berkeley
DNA Sequencing: DoB Joint Genome Institute: http://www.jgi.doe.gov
Clone Distribution: I.M.A.G.E. Consortium/LLNI:
http://image.llnl.gov
Naming Conventions: EST name is generated by the concatenation of
the JGI Clone Id and the direction of sequencing. The suffix '.fwd'
indicates a forward sequencing read of the insert. It does not
necessarily reflect the orientation of the insert.

/done lib="BE04 Normalized and Subtracted bovine embryonic and extraembryonic tissue"
//note="Vector: pGEMZEII(+); Site 1: EcoRI; Site 2: NotI;
//note="Vector: pGEMZEII(+); Site 1: EcoRI; Site 2: NotI;
The cDNA library was constructed_normalized and subtracted by Dr. A. Hernandez, W.M. Keck Center,
University of Illinois Urbana-Champalsn and S. Degrelle,
BDR, Institut National de la Recherche Agronomique,
France, as described in Bonaldo, M.F., Lennon, G. and
Soares, M.B. (1996), Genome Research 6(9): 791-806. This clone is from library BE04, a normalized library of embryonic tissues subtracted with 7800 known placental EST sequences and 5000 clones from the BE03 library. The doubble stranded cDNA was size selected (more than 450 bp), adaptored with EcoRI adaptors at both ends and then digested with NotI. The cDNA was then directionally cloned into EcoRI-NotI digested pGEMILZE(+) phagemid vector.
Insert size was between 450-2200 bp. Sequencing was used to identify the source of the clone. Tagged oligo-dr was used to identify the source of the ESTS where possible. (A18)TGCGT = extraembryonic tissue; (A18)TGCGT = 36-day old fetus; (A18)TGCGA = 64-day old fetus (organs); (A18)TCGGA =
                                                                                                                                                                                                                                                /mol_type="mRNA"

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The sequence represents a polynuclectide which encodes a novel human protein (NHP) containing a CUB domain (an extracellular domain). CUB proteins have been associated with regulating development, modulating cellular processes and preventing infectious disease. NHP nucleotide sequences are useful for gene therapy of physiological disorders or diseases. NHP oligonuclectides are useful as hybridisation probes for screening libraries and assessing gene patterns. NHP nucleotide sequences are useful for detecting mutant or inappropriately expressed NHPB (for example, those proteins associated with obesity, high blood pressure, connective tissue disorders and infertility) for the diagnosis of a disease. The polynucleotides may also be used in screening for drugs effective in the treatment of symptomatic or phenotypic manifestations of perturbing the normal function of NHP in the body. Nucleotide constructs encoding NHP products are used to genetically engineer host cells to express such products in vivo. These host cells allow for the lightification of compounds that bind to NHP receptors or trigger NHP-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  140

The sequence represents a polynuclectide which encodes a novel human protein (NHP) containing a CUB domain (an extracellular domain). CUB proteins have been associated with regulating development, modulating cellular processes and preventing infectious disease. NHP nucleotide sequences are useful for gene therapy of physiological disorders or diseases. NHP oligonuclectides are useful as hybridisation probes for screening libraries and assessing gene patterns. NHP nucleotide sequences are useful for detecting mutant or inappropriately expressed NHPB (for scample, those proteins associated with obesity, high blood pressure, connective tissue disorders and infertility) for the diagnosis of a disease. The polynucleotides may also be used in screening for drugs effective in the treatment of symptomatic or phenotypic manifestations of perturbing the normal function of NHP in the body. Nucleotide constructs encoding NHP products are used to genetically engineer host cells to express such products in vivo. These host cells allow for the indentification of compounds that bind to NHP receptors or trigger NHP-

whose expression is upregulated or downregulated in specific cancers or other diseases such as angiogenic or fibrotic disorders, and to methods of determining the presence or absence of a pathological call in a patient by detecting a nucleic acid at least 80% identical to those of the invention or by detecting a polypeptide of the invention. The invention also relates to expression vectors and host cells comprising a nucleic acid of the invention; antibodies which specifically bind a polypeptide of the invention; use of such antibodies for drug targeting; and methods of screening for modulators of activity or expression of the polypeptides and nucleic acids. The nucleic acids, polypeptides, antibodies and methods are useful for diagnosing, prognosing and treating cancer and other conditions such as psoriasis, ischaemia, heart disease, atthodies are useful for diagnosing, prognosing and treating anterosclerosis, inflammatory diseases, autoimmune diseases, retinal neowascularistaion syndromes, scarring and utterine fibroids. They may also be useful in wound healing and in contraception. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GluserGlyserHissleSerGlyArgGlyPheLeuLeuThrTyrAlaSerSerAspHis 100

The sequence represents a polynucleotide which encodes a novel human protein (NHP) containing a CUB domain (an extracellular domain). CUB proteins have been associated with regulating development, modulating cellular processes and preventing infectious disease. NHP nucleotide sequences are useful for gene therapy of physiological disorders or diseases. NHP oligonucleotides are useful as hybridisation probes for screening libraries and assessing gene patterns. NHP nucleotide sequences are useful for detecting mutant or inappropriately expressed NHPs (for example, those proteins associated with obesity, high blood pressure, connective tissue disorders and infertility) for the diagnosis of a disease. The polynucleotides may also be used in screening for drugs effective in the treatment of symptomatic or phenotypic manifestations of perturbing the normal function of NHP in the body. Nucleotide constructs encoding NHP products are used to genetically engineer host cells to express such products in vivo. These host cells allow for the

Determining the presence or absence of a pathological cell in a patient, useful for diagnosing, prognosing or treating cancer, comprises detecting a nucleic acid in a biological sample.

Claim 8; SEQ ID NO C136; 1385pp; English.

The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
whose expression is upregulated or downregulated in specific cancers or
other diseases such as angiogenic or fibrotic disorders, and to methods
of determining the presence or absence of a pathological cell in a
patient by detecting a nucleic acid at least 80% identical to those of
the invention or by detecting a polypeptide of the invention. The
invention also relates to expression vectors and host cells comprising a
nucleic acid of the invention; antibodies which specifically bind a
cuppeptide of the invention; use of such antibodies for drug targeting;
and methods of screening for modulators of activity or expression of the
polypeptides and nucleic acids. The nucleic acids, polypeptides,
antibodies and ethods are useful for diagnosing, prognosing and treating
cancer and other conditions such as psoriasis, ischaemia, heart disease,
atherosclerosis, inflammatory diseases, autoimmune diseases, retinal
neovascularistaion syndromes, scarring and uterine fibroids. They may sequence represents a nucleic acid sequence of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a method for detecting cancer in a patient. The method comprises detecting in a biological sample from the patient a nucleotide or protein sequence comprising a sequence that is at least 80% identical to a nucleotide sequence (ADR46588-ADR46645) protein sequence (ADR46646-ADR46703). The method is useful for detecting cancer for preparing a composition for diagnosing or treating cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           80
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       50

The method comprises detecting in a biological sample from the patient a nucleotide or protein sequence comprising a sequence that is at least 80% identical necessary a nucleotide sequence (ADR46588-ADR46645) or protein sequence (ADR46646-ABR46703). The method is useful for detecting cancer for preparing a composition for diagnosing or treating cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            341

The invention relates to secreted polypeptide-related proteins and nucleic acids (TANGO and INTERCEPT proteins and nucleic acids). The nucleic acids, proteins and antibodies specific to the proteins are nucleic acids, proteins and antibodies specific to the proteins are useful in screening assays, predictive medicine (e.g. diagnostic assays, predictive medicine (e.g. diagnostic assays, predictive medicine (e.g. diagnostic assays, predictive methods. The sequences are used in prophylactic and therapeutic methods. The sequences are used in cancers), hormonal disorders (e.g. quibates or thyroid disorders), immune (e.g. Alzheimer's disease or Parkinson's disease), cardiovascular disorders (e.g. myocardial infarction or congestive heart disease), blood placelet disorders (e.g. thrombocytopenia or ansemia) and disorders (round) and assurrogate markers. This sequence represents a secreted cology, and as surrogate markers. This sequence represents a secreted cology, and assurrogate markers. This sequence represents a secreted cology and assured in chromosome mapping, tissue typing and forensic cological and part of the invention. Note: The sequence data for this part of the invention or format directly from USPFO at

The invention relates to human polynucleotides and the polypeptides they encode. The invention also relates to a host cell containing a polymerleotide of the invention, an antibody which selectively binds with a polypeptide of the invention, an enthod of detecting the presence of a polypeptide in a sample, a method of identifying a compound which binds with a polypeptide, and a method of identifying a compound which binds with a polypeptide. The polymercides of identifying a compound which binds polypeptide. The polymercides, polypeptides and compositions are useful for diagnosing, preventing and/or treating cancer, obesity, cardiovascular disorders, arthritis, astarhoad, anaemia, graft-versus-host reactions, allergic reactions, cystic fibrosis, hypogonadism, cardiovascular disorders, arthritis, osteoarthritis, arteriosclerosis, hypotransion, bacterial infections, psoriasis, disease, Parkinson's disease, Albs, tuberculosis, viral infections, malaria, goiter, infertility, endometriosis, wounds and muscular disorders. This sequence represents a human polymucleotide of the printed specification but was obtained in electronic format from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New TANGO, INTERCEPT, and MANGO, useful in diagnosing, preventing, and treating cancer, constituent hemorrhoids, cystic fibrosis, hypogonadism, psoriasis, hepatitis, Alzheimer's disease, AIDS, tuberculosis, malaria, goiter, infertility.

Xu Y, Kallick DA, Lee EA, Thangavelu K, Delegeane AM, Lee S; Novel isolated human extracellular matrix and cell adhesion molecules useful for treating, preventing connective tissue disorder e.g. osteoporosis, Paget's disease, genetic disorder e.g. cystic fibrosis, thalssemia.

Claim 11; SEQ ID NO 47; 270pp; English.

The invention relates to a novel isolated human extracellular matrix and cell adhesion molecule (referred to as ECMCAD 1-36), its biologically active or immunogenic fragment or a sequence comprishing 90 % identity to ECMCAD 1-36. The molecule is useful for acreening a compound for ECMCAD 1-36. The molecule is useful for acreening a compound for effectiveness as agonist or antagonist of itself. The protein and its concoding nucleic acid are useful in the diagnosis, treatment and prevention of genetic disorder such as adrenoleukoyatrophy, Down's prevention of genetic disorder such as acquired immunodeficiency syndrome (AIDS), adult respiratory distress syndrome, allergies, anemia, asthma, atherosclerosis, autoimmune (EC as acquired immunodeficiency syndrome (AIDS), adult respiratory distress syndrome, allergies, anemia, asthma, atherosclerosis, psoriasis, rheumatoid arthritis, scleroderma, systemic lupus erythematosus, ulcerative colitis, C drave's disease, multiple sclerosis, osteoporosis, psoriasis, rheumatoid arthritis, etc., a neurological disorder such as espilepsy, stroke, allesase, Huntington's disease, Parkinson's disease, multiple sclerosis, berinding mood, anxiety, and schizophrenic disorders, amnesia, disease, osteoporosis, psoriasis, periodic paralysis, mental disorders including mood, anxiety, and schizophrenic disorder such as concerned signat cell tumor, psoriatic arthritis, infectious arthritis, systemic sclerosis, atherosclerosis, hepatitis, infectious arthritis, such as actinic keratosis, atherosclerosis, hepatitis, including adenomentation, hepatitis, nellong, and a cell proliferative disorder such as actinic keratosis, atherosclerosis, hepatitis, psoriasis, cancers including adenomental and a cell proliferative disorder such as actinic keratosis, atherosclerosis, hepatitis, psoriasis, cancers including adenomental and a cell proliferative disorders including adenomental and a cell and a cell as actinic keratosis, atherosclerosis, hepatitis, psoriasis, cancers and a cell as actinic keratosis, a one of the encoding This sequence represents the cDNA sequence

```
retinopathies (including diabetic retinopathy and macular degeneration), atherosclerosis, psoriasis, rheumatoid arthritis and growth factor-semaphorin interactions, for repairing neurological damage due to stroke, head and spinal injuries, for treating neurological damage due to stroke, head and spinal injuries, for treating neurodegenerative diseases of such as multiple sclerosis, Alzheimer's disease, and parkinson's disease, for mediating development and innervation of stomach tissue, for identifying, labeling, and isolating selected cell types, as a target for cell-specific delivery of diagnostic and therspeutic agent, and to identify inhibitor of zcub5 activity. The zcub5 polypeptide, polynucleotide and modulators are useful in diagnosis or treatment of disorders associated with abnormal cell proliferation, including cancer, impaired or excessive vasculogenesis or angiogenesis and diseases of the nervous system. The present sequence represents a cDNA encoding the human cubs polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PheCysProAlaGlyCysArgAspValAlaGlyAspIleSerGlyAsnMetValAspGly 140

The polypeptide can be expressed by standard recombinant methodology. The zcub5 polypeptide and polymotleotide are useful in a variety of therapeutic, diagnostic and research applications. The polypeptide is useful for producing antibodies, for imaging tumours or

The sequence represents a cDNA which encodes human TANCO 229 polypeptide.

This protein and similar others exhibit the ability to affect growth, proliferation, survival, differentiation, activity, morphology, or movement/migration of, e.g. T cells and cells of the heart, liver, comesent, placenta, brain, lung, skeletal muscle, kidney, spleen, lymph node, peripheral blood leukocyte, bone marrow or thymus tissue. They can be used as modulating agents for regulating cellular processes, thus, the proteins and their associated nucleic acids can be used to prognosticate, provent, diagnose, or treat disorders associated with physiological processes. These disorders include abnormal blood coagulation, anthma, anaphylaxis, hepatitis, multiple sclerosis, cancer, coronary artery disease, malaria, atopic dermatitis, amyotrophic lateral sclerosis, canaphylaxis, attention deficit disorder, Crohn's disease, gastroenteritis, goitre, hypoglycaemia, diabetes mellitus, endometriosis, pulmonary composities, attention deficit disorders (from season as these embolism and muscular dystrophy. Antibodies to disorders such as these can be made by providing a polypeptide of the invention to an immuno-composition to an immuno-composities.
                                                                                                                                                                        New isolated nucleic acid molecule for diagnosis, prevention, and therapy of human and other animal disorder, or as modulating agent for regulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                287
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         347

New nucleic acid molecule encoding a secreted protein (e.g. TANGO 202, TANGO 210 or INTERCEPT 217), useful for diagnosing, preventing or treating disorders such as cancer, diabetes or atherosclerosis, and in biology forensic

Claim 2; Fig 10A-10F; 482pp; English.

The invention relates to secreted polypeptide-related proteins and nucleic acids (TANGO and INTERCEPT proteins and nucleic acids). The nucleic acids, proteins and antibodies specific to the proteins are useful in screening assays, predictive medicine (e.g. diagnostic assays, producting clinical trials and pharmacogenetics) and prophylactic and therapeutic methods. The sequences are used in diagnostic and therapeutic methods. The sequences are used in diagnosting, preventing or treating proliferative disorders (e.g. diagnosting, preventing or treating proliferative disorders) immune cancers), hormonal disorders (e.g. diabetes or thyroid disorders) immune clisorders (e.g. multiple sclerosis or lupus), neurological disorders (e.g. myocardial infarction or congestive heart disease), blood platelet disorders (e.g. thromborytopenia or annemia) and disorders involving blood vessels (e.g. atherosclerosis or vasculitis). The nucleic caids may also be used in chromosome mapping, tissue typing and forensic biology, and as surrogate markers. This sequence represents a secreted polypeptide-related cDNA of the invention. Note: The sequence data for this patent was obtained in electronic format directly from USPTO at seqdata.uspto.gov/sequence.html

```
The invention relates to human polynucleotides and the polypeptides they encode. The invention also relates to a host cell containing a polypeptide of the invention, an antibody which selectively binds with a polypeptide of the invention, a method of detecting the presence of a polypeptide in a sample, a method of identifying a compound which binds with a polypeptide, and a method of modulating the activity of a polypeptide. The polynuclectides, polypeptides and compositions are useful for diagnosing, preventing and/or treating cancer, obesity, gastritis, diarrhoes, haemorrhoids, asthma, ansemia, graft-versus-host reactions, allergic reactions, cost of the prosis, hypogonalism, cardiovascular disorders, arthritis, osteoarthritis, arteriosclerosis, hypertension, bacterial infections, psoriasis, diabetes mellitus, chepatitis, Alzheimer's disease, Huntington's disease, Parkinson's disease, AlDS, tuberculosis, viral infections, malaria, goiter, infertility, endometriosis, wounds and muscular disorders. This sequence represents a human polymucleotide of the invention. Note: The sequence data for this parent did not form part of the printed specification but was obtained in electronic format from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 and

encoded by the markers, antibodies that selectively bind to the polypeptides, a method of inhibiting ovarian cancer in a patient at risk of developing ovarian cancer involving inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a patient afflicted with ovarian cancer comprising providing to calls of the patient afflicted with ovarian cancer comprising providing to calls of invention. The markers are useful for assessing if a patient is afflicted with ovarian cancer useful for assessing if a patient is afflicted with ovarian cancer sample. A difference between the amarker in a control non-ovarian cancer sample. A difference between the marker in a patient sample and a normal level of expression of the marker in a control non-ovarian cancer. The level of expression of a marker corresponds to a secreted protein or a transcribed colling the presence in the sample, a protein or protein fragment corresponding to the marker. The presence of protein or protein fragment is detected using an antibody that specifically binds with the control or protein fragment is detected using an antibody that specifically binds with the the marker is assessed by detecting the presence of a transcribed the polymucleotide which anneals with the marker or anneals with a portion of a marker is also seen the polymucleotide which anneals with the marker is a leavent of the marker in a leavent of the marker is a leavent of the marker in a leavent of the marker is a leavent of the marker in a leavent of the marker is a 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        marker is also used for monitoring the progression of ovarian cancer in a patient which involves detecting expression of the marker in a patient sample at a first point in time, repeating the method at a subsequent time and comparing the lavel of expression. The method is carried out using an ovarian tissue sample. A composition comprising a marker, polypeptide or antibody of the invention is used to treat ovarian cancer. This sequence repersents a human ovarian cancer DNA marker of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   353
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        413
